ABSTRACT

Industry models for planning the efficient decommissioning of a nuclear power plant continue to evolve. Effective planning is a key to cost control, a critical aspect of decommissioning. In 2001, the Electric Power Research Institute (EPRI) published the "Decommissioning Pre-Planning Manual", referred to as the "Manual". The goal of the Manual was to develop a framework for use in pre-planning the decommissioning of a nuclear power plant. The original research was based on information collected during the active decommissioning of power reactors in New England, and the ongoing decommissioning planning of another reactor still in operation. The research team identified thirty-two (32) major Decommissioning Tasks that support the strategic and tactical planning that can be conducted in advance of plant shutdown. The Decommissioning Tasks were organized in a logical sequence of execution, and sorted in common discipline groupings. Owners of U.S. nuclear plants that have shut down prematurely during the past 5 years have found the EPRI Decommissioning Pre-Planning Manual useful in developing their transition plans from an operating to shutdown facility.

Concurrently, during the past 15 years, the IAEA has published numerous technical and safety reports on nuclear reactor decommissioning planning and execution. IAEA's goal is to provide its global members with useful and timely guidance for the planning and execution of nuclear decommissioning projects. This information has been used extensively by international nuclear plant operators.

One of the key objectives will be to develop a roadmap linking the 32 EPRI Decommissioning Tasks with the comparable (or equivalent) topics covered in the IAEA library of decommissioning knowledge. The logical and convenient structure of the Manual will be cross-referenced to the IAEA topics to aid in organizing the development of decommissioning plans. The roadmap will serve to provide a basis for improved communication and collaboration between U.S. and international decommissioning planners.

The paper will also provide a summary of changes that have occurred since the Manual was published in 2001. Major differences and gaps between the Manual and the IAEA will be identified, with recommendations for future development provided.

Background

Industry models for planning the efficient decommissioning of a nuclear power plant continue to evolve. Effective planning is a key to cost control, a critical aspect of decommissioning. In 2001, the Electric Power Research Institute (EPRI) published the "Decommissioning Pre-Planning Manual" [29], referred to as the "Manual". The Manual was developed by AREVA under contract with EPRI. The goal of the Manual was to develop a framework for use in pre-planning the decommissioning of a nuclear power plant. The original research for the Manual was based on information collected during the active decommissioning of power reactors in New England, and the ongoing decommissioning planning of another reactor still in operation. The research team identified thirty-two (32) major Decommissioning Tasks that support the strategic and tactical planning that can be conducted in advance of plant shutdown. The Decommissioning Tasks were organized in a logical sequence of execution, and sorted in common discipline groupings. Owners of U.S. nuclear plants that have shut down prematurely during the past 5 years have found the Manual useful in developing their transition plans from an operating to shutdown facility.

Concurrently, during the past 20 years, the International Atomic Energy Agency (IAEA) has published numerous technical and safety reports on nuclear reactor decommissioning planning and execution. IAEA's goal has been to provide its global members with useful and timely guidance for the planning and execution of nuclear decommissioning projects. This information has been used extensively by international nuclear plant operators.

Objectives of this Paper

The major objectives of this paper are:

- 1. To present a summary of the Manual as originally drafted in the 2001 report. This review will provide a basis for understanding the contents of decommissioning planning activities that have been conducted in the United States.
- 2. To provide an update of changes to the Manual that should be considered based on decommissioning industry developments since 2001.
- To present a sample matrix that cross-references the Manual topics to IAEA reports containing decommissioning content. Cross-reference matrices provide decommissioning planners from different countries an efficient and useful tool for identifying the tasks required to achieve excellence in reactor decommissioning planning.
- 4. To present a sample matrix that cross-references the typical contents of a Decommissioning Plan, as presented in IAEA Safety Reports Series No. 45 [3] entitled "Standard Format and Content for Safety Related Decommissioning Documents," to the Manual . This will serve to demonstrate the applicability of U.S.-based decommissioning planning processes to those implemented in other countries, regardless of maturity.

Description of 2001 EPRI Decommissioning Pre-Planning Manual

Since publication in 2001, the Manual has been widely adopted by U.S. reactor owners as a useful reference for conducting the decommissioning planning of commercial power reactors. The knowledge gained from decommissioning numerous reactors during the 1990s (i.e., Yankee Rowe, Maine Yankee, etc.) formed the basis for the Manual. During the past 15 years, many reactor decommissioning projects have been concluded, leaving behind a restored site along with an Independent Spent Fuel Storage Installation (ISFSI) awaiting Department of Energy action. Most recently, San Onofre, Kewaunee, and Vermont Yankee have been prematurely shut down. With the advent of persistently

low natural gas prices in the U.S., merchant nuclear plants (in particular) will continue to see increasing economic pressure resulting in eventual permanent shutdown of these plants.

Whereas the Manual is intended for use at any stage of a nuclear plant's life cycle, it is ideally suited for operating plants with sufficient lead time before the final operating cycle. Transition from a power operation to a decommissioning mentality is not something easily accomplished with an organization accustomed to generating electricity.

The Manual is decommissioning-strategy neutral, therefore it can be applied to either U.S. NRC DECON (immediate dismantlement) or SAFSTOR (safe storage for a defined time period, then dismantlement) decommissioning strategies.

The Manual presents sixty-five (65) Decommissioning Activities (DA) organized into thirty-two (32) Decommissioning Task Outlines (DTO). The DTOs can best be described as major topics comprising distinct and separate scopes of work worthy of independent classification. The DAs correspond to sub-topics within the frame of the major DTO topics. The DTOs and DAs are very useful as starting points for decommissioning work breakdown structures (WBS), project schedules, and decommissioning cost estimates (DCE). The DTOs can also correspond to a WBS Level 2, with DAs corresponding to WBS Level 3.

Each DA is presented in detail in the Manual and includes a description of the following:

- Objective of the DA
- Value to the planner
- Prerequisites
- Task description
- Resources required to develop
- Description of deliverable
- Useful references

Exhibit 1 presents the DTOs and the DAs with their respective professional disciplines (also refer to Tables 3-1 and 3-2 in the Manual). The DAs are arranged in groupings according to the professional disciplines that will lead each DA. The four professional groupings include:

- 1. Management, Finance and Human Resources
- 2. Licensing, Operations, Training and Quality Assurance
- 3. Engineering
- 4. Environmental Management and Occupational Health and Safety

A unique and useful feature included in the Manual is the Decommissioning Pre-Planning Precedence Diagram presented in Exhibit 2 (also refer to Figure 3-1 in the Manual). Whereas the precedence diagram provides a conceptual diagram of the sequence in which the DTOs should be developed, it is based on the actual experience gained during the decommissioning of U.S. nuclear plants during the 1990s. It is worth noting that DTOs will develop both sequentially and as parallel undertakings. This sequencing diagram has proven to be useful for developing early decommissioning pre-planning critical path schedules. A similar approach may be applied to the IAEA decommissioning planning processes that can be adapted to country-specific regulatory processes.

Update of Changes to the Manual since 2001

Reactor decommissioning has continued to evolve since publication of the Manual in 2001. The authors of this paper have performed a review of the Manual in conjunction with industry lessons learned with the goal of updating it to reflect meaningful changes that have occurred that are worthy of note in this discussion.

The following specific topical areas are recommended for consideration as either new DTOs or as an addition to an existing DTO:

- 1. Dismantling Strategy (early developments of potential options)
- 2. Final Status Survey
- 3. Site Closure Plan
- 4. Records Management
- 5. Risk Assessment
- 6. Need for Mitigating Strategies
- 7. Review Regulatory Environment/Changes

Each of these topic areas are described below as candidates for further DTO development.

Dismantling Strategy (early developments of potential options)

Critical to decommissioning is having a clear understanding of what can and can't be done based on the status of the nuclear decommissioning trust fund (NDT) and projected timing of the plant shutdown. With the recent premature shutdowns due to changing energy market conditions and utility economics, decommissioning trust funds are not fully funded leading to conditions where a plant must wait to begin active decommissioning. This DTO would focus on those steps necessary to identify options and develop plans for dismantlement activities based on the availability of those funds.

Final Status Survey

When the Manual was published in 2001, there was little experience on the actual conduct of license termination activities (DTO 21), specifically with respect to adopting and implementing site release criteria and development and conduct of final status surveys. The design, development and execution of the final status surveys in conjunction with the MARSSIM guidance is used to demonstrate compliance with the established site release criteria. This DTO would describe the process for development of the final status surveys to support license termination and release of the property.

Site Closure Plan

Decommissioning should begin with a clear vision, i.e. "begin with the end in mind." This DTO would focus on development of a description of what the expected end state is for ultimate release of the property and license termination. The objective of this document would be to (1) delineate the process which would be used to complete the decommissioning, environmental investigation, environmental remediation, site closure and post-closure property transfers, and (2) to identify all of the significant regulatory approvals and permits necessary to carry out the decommissioning, environmental remediation and site closure activities. The key to this document is gaining alignment of all pertinent stakeholders with this plan to achieve those objectives in a timely and efficient manner by:

- Engage regulators early in the process
- Gain alignment on "End State" and approach with all regulators as soon as possible
- There are multiple regulators involved and the criteria for performance and end-state achievement are not always clear or consistent

- RCRA closure (Chemical Remediation) is as challenging as License Termination (Radioactive Remediation)
- Clarity and reliability in the regulatory process is crucial to project success
- Regulatory alignment with plan and approach is fundamental to stakeholder confidence

Records Management

Many of the plant records are important to the safety and cost efficient planning for decommissioning. The early development of a systematic approach to records management to support decommissioning is therefore important. Numerous lessons learned have been developed that indicate the necessity of an effective records management system. The following questions could be asked in developing an approach to records management (and potential request for exemption from records retention requirements to eliminate records no longer needed):

- Is the record needed to support only continued safe operation?
- Is the record needed as a license requirement?
- Is the record needed to quantify/characterize waste?
- Is the record needed for future decommissioning tasks?
- Is the record needed for long-term care/maintenance (i.e., spent fuel management)?
- Is the record needed to preserve exposure information?
- Is the record new data since last records review?
- Is the record needed in potential litigation?
- Is the record one that should be retained although not directly related to operations or decommissioning?
- Is the record considered to be non-permanent?

Risk Assessment

This DTO would focus on identifying and understanding the risks associated with decommissioning and the choices made to accomplish those tasks, given that risks change immediately and throughout the project. Due to nature of the work, "unknowns" are often encountered and contingency planning (schedule and cost) is crucial to success.

The art and science of project risk management has evolved to a point where robust methods can be employed to systematically identify risks and anticipate responses to risks should they occur. Fundamentally, a sound risk management approach would involve deployment of a tool containing the following basic steps:

- Risk identification
- Risk analysis
- Prioritization of risks
- Development of risk responses
- Implementation of risk strategies and tactics
- Evaluation of risk strategy results
- Documentation of risk strategy results

The most successful project risk management techniques involve those where project stakeholders actively maintain a "living risk register" database that is continually updated.

Need for Mitigating Strategies

Mitigation strategies were required for operating reactors and most of these strategies can be eliminated once the plant is permanently shut down. Some strategies, however, may be required for maintenance of spent fuel pool makeup capability and preservation of water inventory over the spent fuel while it is stored in the fuel pool. This issue would need to be addressed in an update to DTO 7, Certifications, Exemptions Requests and Fee Relief, with submittal of those exemptions and license amendment necessary for Emergency Plan changes.

Review Regulatory Environment/Changes

A clear understanding of the regulatory environment is crucial to successful decommissioning. Understanding what changes can be made with and without prior regulatory approval is critical. Having an updated licensing basis based on the permanently shut down condition is important to timely execution of changes necessary to get to conditions where decommissioning can begin efficiently and safely (i.e., cold & dark and SFP island implementation). Understanding what additional regulatory processes (i.e., State and/or local related) are necessary to undertake, and potentially approve, decommissioning activities is critical to planning and scheduling activities. An update to DTO-19, Federal/State/Local Regulatory Compliance, would be considered to address these regulatory issues.

EPRI Decommissioning Pre-Planning Manual/IAEA Cross-Reference Matrix

IAEA, EPRI and others have published reports covering a wide range of decommissioning topics from planning guidelines and technical requirements to actual project lessons learned and experience summaries. To date, no one has provided a consolidated cross-reference between the IAEA decommissioning documents and where they apply in the decommissioning process.

Therefore, AREVA decommissioning engineers recently developed a Decommissioning Planning Matrix that cross-references the 65 DAs categorized in the 32 DTOs within the Manual with the contents of numerous IAEA reports and technical documents. The matrix does not include all of the currently available IAEA reports on decommissioning, but represents a critical mass of information considered suitable for decommissioning planning. The matrix provides an additional benefit of cross-referencing individual IAEA report contents with those of other IAEA reports. The matrix is not intended to be all inclusive, but serves as a living reference database that can be revised and expanded as new information becomes available.

Exhibit 3 & 5 present cross-reference matrices that were created as quick reference guides.

By looking at the matrices one can see "X" for each IAEA document that contains information for a specific DA. As example in Exhibit 3, using the matrix for a search on the topic of "Radiation Exposure Estimates" (EPRI DA Number 59) will identify 10 IAEA documents having information that may be helpful in further understanding this topic. Use of this tool makes it easy to gain knowledge on decommissioning topics by being able to see which documents contain information and then going directly to the source. Before the creation of this matrix, a search through a number of documents was required to find the needed information. In addition, the matrix can be used to place IAEA documents into the Manual recommended order of activities.

Exhibit 3 cont'd: EPRI Decommissioning Pre-Planning Manual / IAEA Cross-Reference Matrix

Alignment Matrix between IAEA Decommissioning Plan Outline and EPRI Manual DTOs

Of the many key documents required to conduct decommissioning at nuclear power plants, the decommissioning plan stands out as the most comprehensive. IAEA refers to the decommissioning plan as "the cornerstone of a successful decommissioning project." This has been validated with international clients who seek to learn about the process of developing a decommissioning plan in an efficient and orderly manner. With that in mind, the authors reviewed IAEA Safety Report No. 45 [3] with the goal of cross-referencing those contents with the Manual.

The resulting matrix, presented in Exhibit 4, demonstrates that there is significant consistency between IAEA and the Manual. Most of the topics of concern are covered in both documents, albeit using a different structure. The Exhibit 5 was prepared by combining the matrix presented in Exhibit 3 with the Cross-Reference of Exhibit 4.

The matrix thus becomes a useful communication tool for U.S. and international decommissioning planners to find common ground when working together to develop decommissioning solutions for nuclear facilities throughout the world.

During the preparation of the alignment matrix, some DTOs did not actually find matches in the typical decommissioning plan outline, thus creating only a one-way cross-reference relationship. These discrepancies were very limited and all the critical activities matched with a DTO & DA. The alignment highlights the coherence between the U.S. approach to prepare multiple documents during the Decommissioning Planning phase and the IAEA approach to prepare one master document called the Decommissioning Plan which incorporates most of the U.S. separate documents.

PREDEC 2016: Applicability of EPRI Pre-Planning Manual to Int'l D&D Projects, February 16-18, Lyon, France

Exhibit 5 (cont'd): IAEA TSR45 Activities grouped according to EPRI DTOs with IAEA References

Summary

There are over 400 nuclear plants in the world, many of them approaching end of life. Decommissioning planning will be required to ensure that nuclear plants will decontaminated and dismantled in an orderly and safe manner, with the ultimate goal of restoring the sites for reuse. The Manual, used in conjunction with the IAEA reports on decommissioning, provides nuclear decommissioning planners with an abundance of useful information.

This paper concludes that:

- 1. The Manual published in 2001 continues to be a meaningful reference for reactor decommissioning planning, both in the U.S. and internationally.
- 2. There have only been a few new U.S. industry developments that would result in slight modification to the Manual. These include:
 - Dismantling Strategy (early developments of potential options)
 - Final Status Survey
 - Site Closure Plan
 - Records Management
 - Risk Assessment
 - Need for Mitigating Strategies
 - Review Regulatory Environment/Changes
- 3. The EPRI-IAEA matrices presented herein are very useful planning tools that should enhance the effectiveness of the decommissioning planning process.
- 4. The subject matrices are excellent communication and training tools that should be maintained as living documents for the duration of decommissioning life cycles.
